

- Formula: Elicit -> Provide -> Elicit
- Move: draw out context or permission, offer information briefly, then elicit response or meaning
- Minimum: Would it be useful to hear one option? The option is X. What do you make of that?
- Best for: autonomy-sensitive advice, behaviour change, clinical-style explanations and coaching
- Avoid when: when you intend to ignore their response or when a brief directive is required
- Failure mode: using questions as decoration around advice you were going to impose anyway
- Neighbour: Ask-Tell-Ask - Use Elicit-Provide-Elicit when the Elicit -> Provide -> Elicit structure is the main need; use Ask-Tell-Ask when that adjacent move better serves the moment.
- Neighbour: Permission-Based Advice - Use Elicit-Provide-Elicit when the Elicit -> Provide -> Elicit structure is the main need; use Permission-Based Advice when that adjacent move better serves the moment.
