

- Formula: Ask -> Tell -> Ask
- Move: ask for their starting point, tell the information concisely, then ask what they make of it
- Minimum: What is your sense of this so far? Here is the key point. How does that land?
- Best for: education, feedback, clinical explanations, coaching and complex information sharing
- Avoid when: token collaboration, urgent commands or when the person has declined advice
- Failure mode: letting the Tell become a lecture and the final Ask become cosmetic
- Neighbour: Elicit-Provide-Elicit - Use Ask-Tell-Ask when the Ask -> Tell -> Ask structure is the main need; use Elicit-Provide-Elicit when that adjacent move better serves the moment.
- Neighbour: Permission-Based Advice - Use Ask-Tell-Ask when the Ask -> Tell -> Ask structure is the main need; use Permission-Based Advice when that adjacent move better serves the moment.
